Includes all Irish (white) potatoes for harvest before September 1 in 10 Southern States and California.

Percent of previous year's crop.

CROP REPORT as of April 1, 1943 . 3:00 P.M. (E.W.T.

BUREAU OF AGRICULTURAL ECONOMICS CROP REPORTING BOARD

Washington, D. C., April 9, 1943 3:00 P.M. (E.W.T.)

GENERAL CROP REPORT AS OF APRIL 1. 1943

Crop prospects were lowered and farm work was delayed by the stormy weather of March and the combined effect of all weather conditions affecting this year's crop would now seem rather less favorable than average if it were not that there is a fair reserve of subsoil moisture under most of the Great Plains Area and irrigation prospects are good to excellent in most sections west of the Rockies.

Until late in March, severely cold weather, alternating with warm periods, caused extensive damage to fruit buds in States east of the Rockies and nipped tender vegetables in portions of the Gulf States. In northern States winter wheat and clover have been extensively damaged where not protected by a snow blanket. Winter oats and winter barley have suffered severely in parts of the South and Southwest. Heavy rains and floods have hampered work in much of the area south of the Onio River and also in portions of North Dakota. While recent rains have helped greatly, more rain is needed in the western half of Texas, northwestern Oklahoma, most of New Mexico, western Kansas and portions of Nebraska and southern South Dakota.

Although spring work on the farms was retarded over most of the country east of the Rockies, farmers have been making rapid progress wherever conditions permitted. Widely scattered States report unprecedented numbers of women helping in the fields. In many cases, various members of the farm families from grandfathers to school girls are taking turns to keep the tractors rolling. This type of cooperation plus the mechanization of the farms is all that will make it possible to raise an increased acreage of crops this year. Theoretically, the 1,900,000 tractors on the farms in the United States have a capacity of plowing l_2^1 million acres per hour. At that rate, if they could all be worked at once, they could do a year's plowing in two weeks of good weather. Actually the job is not so easy for on most of the smaller farms horses and mules must continue to pull the plows. In the more important farming areas, however, there is sufficient mechanical power to do the spring work if the tractors could be worked to capacity and the horses shifted to lighter jobs.

Present prospects are for a moderate increase in the total crop acreage in the main commercial farming areas, only slightly offset by decreases on some "submarginal" and "subsistance" farms and on "part-time" farms within commuting distance of industrial areas. The increases will be chiefly in crops needed to meet production goals but, owing to labor conditions, there will be local reductions in crops with high labor requirements, such as sugar beets, strawberries, and commercial vegetables. Plantings will also depend more than usual on the weather.

Fruit prospects appear promising in the West and citrus trees in Florida and Texas ere blooming satisfactorily, but prospects for other fruits are below average in most areas east of the Rockies. The peach crop in 10 Southern States suffered severely from winter and spring freezes. The reported acreages of watermelons, cantaloups, and strawberries, which supplement the tree fruits on the market, are showing sharp reductions. Acreages of other vegetables reported being grown or planned for market show reductions that average about 9 percent. Carrots show the only significant increase.

April 1 stocks of corn and oats on farms totaled about 47 million tons. This was 10 percent more than last year and 14 percent more than on any other April 1 in more than 20 years. These grains, however, are being used up rapidly, and the quantity used up between January 1 and April 1 was 20 percent greater than in the same period last year. This increased disappearance was due in part to the 11 percent increase in the combined units of grain consuming livestock and poultry on the farms.

CROP REPORT
as of

OROP REPORTING BOARD

Washington, D. C., April 9, 1943 3:00 P.M. (E.W.T.)

The quantity of these grains fed or disappearing per unit of livestock was also 9 percent heavier than in the same period last year and the highest in more than 20 years. If this liberal feeding continues, stocks of corn and oats remaining on farms on July 1 will be down to about the 1938-41 average for that date, while units of livestock and poultry on farms are likely to be 20 to 25 percent above the average in those years.

Pastures have been slow in starting and the delay in the opening of the pasture season has caused an acute shortage of hay in the Pacific Northwest and local shortages in some other Western States. Western ranges show prospects that vary from barely fair in parts of the Southwest where rain is badly needed to very good in North Dakota and Montana where there is enough moisture to insure a new crop of grass and enough old feed on the ranges to carry stock for the present.

WINTER WHEAT: Indicated production of winter wheat of 558,551,000 bushels is 145 million bushels less than last year's large crop, and near the average of 550 million bushels. Quite generally adverse winter temperature and moisture conditions, and the late start of spring growth are evidenced in the decline in prospects since December of 66 million bushels.

Wheat came through the dormant stage showing widespread damage from severely low and variable winter temperatures and limited surface moisture in some areas. Until early February, snow cover was generally sufficient for adequate protection from the low temperatures. Later, however, there were severe cold spells, and sharp changes from freezing to thawing. Much heaving and loss of acreage occurred in the area along the Ohio River, and westward through southern Illinois, Missouri, and northern Arkansas. In the southern Great Plains States, shortage of surface moisture was becoming acute by April 1, and the outcome was dependent on timely rains, though alleviated somewhat by fairly adequate subsoil moisture. Some loss from green bugs is again threatened in Texas and Oklahoma. The Northwestern States suffered a severe setback because of deficient precipitation from seeding time through the winter, low winter temperatures and a late spring. There was a heavy loss of fall sown acreage and yield prospects are low on acreage remaining for harvest. A somewhat more favorable condition exists in the Southwest, particularly in California where condition is above average.

The loss of acreage due to winter losses and diversion is indicated at 10.4 percent, compared with the 6.7 percent indicated on December 1, 1942, and the 7.0 percent 1942 abandonment.

The indicated yield per seeded acre is 14.9 bushels, compared with 18.3 bushels last year and the 11.4 bushel average. Yields indicated on April 1 are lower than last year in all of the important States except California, and the 3 States (Indiana, Illinois, and Missouri) where winter damage to the 1942 crop was so severe. Sharply lower yields are in prospect in the Pacific Northwest.

WHEAT STOCKS: Stocks of wheat on farms on April 1 are estimated at 327,667,000 bushels, equal to 33.4 percent of last year's production. These farm reserves are 1/5 larger than the record 269 million bushels on farms last April 1. Farm stocks, large in comparison with January 1 reserves are principally in an area comprising parts of Wisconsin, Minnesota, and Iowa, where feed reserves apparently are being built up; in the Plains States from North Dakota to Texas, and in Montana and Washington where the 1942 crop was large. Farm stocks are low in the eastern Corn Belt States, Ohio, Indiana, and Illinois.

CROP REPORT

BUREAU OF AGRICULTURAL ECONOMICS CROP REPORTING BOARD

Washington, D April 9, 1943 3:00 P.M. (E.W.T.)

The January-April disappearance of wheat -- 167 million bushels -- is the largest on record for this quarter, comparing with approximately 104 million bushels disappearance in the corresponding quarter last year. Movement from farms was heaviest in some central States with heavy feeding needs, and in the surplus producing Plains States.

CORN STOCKS: Farm stocks of corn on April 1, 1943, were 1,395,112,000 bushels. This is 49 percent above the 10-year (1932-41) average of 935,080,000 bushels and is the largest on record for this date. Disappearance of corn from farms during the first quarter of 1943, totaling 882,220,000 bushels, was by far the largest on record. Last year, disappearance during the same months amounted to 726,816,000 bushels -- previous largest on record -- while the 10-year (1932-41) average disappearance is 581,385,000 bushels.

These estimates of corn stocks cover total stocks of grain corn on farms including carryover from previous years and corn under seal on Government loans. The quantity of sealed corn on farms in the commercial corn area, which includes all important counties in the North Central States was approximately 116 million bushels on April 1. Corn under seal on this date for previous years amounted to 262 million bushels in 1942, 299 million in 1941 and 451 million in 1940.

Stocks on farms April 1, 1943 were equal to 48.4 percent of the 1942 production of corn for grain, compared with 53.0 percent on April 1, 1942 and 44.5 percent, the 10-year (1932-41) April 1 average.

In the North Central States farm stocks were 11 percent above those a year ago and 64 percent above average. Record supplies remain on farms despite the largest disappearance on record. In Iowa, stocks remain at the high level first attained in 1939. While above last year, they are less than in two other years on April 1. Stocks in Illinois are somewhat below those of a year ago, but considerably above average and sixth highest on record. In Ohio, Indiana, Michigan, Wisconsin and South Dakota, April 1 stocks are the largest on record, and in Nebraska and Kansas the largest since 1933. Disappearance of corn since January 1 in the North Central States was 671,134,000 bushels -- 28 percent above the previous high occuring during the first quarter of 1942.

Except for the North Central and North Atlantic States, April 1 holdings on farms in other regions of the United States were lower than a year ago, although above average in all but the South Atlantic States. Principal reductions compared to last year were in the Gulf States and most Western States.

OATS STOCKS: Stocks of oats remaining on farms April 1, 1943 are estimated to total 508,208,000 bushels. This is about 76 million bushels or 18 percent larger than the stocks on hand on April 1, 1942, and 130,791,000 bushels larger than the 10-year (1930-39) April 1 average of 377,417,000 bushels.

CROP REPORT April 1, 1943

BUREAU OF AGRICULTURAL ECONOMICS CROP REPORTING BOARD

Washington, D. C. April 9, 1943 . 3:00 F.M. (E.W.T. <u>ក្រោយ នោះ ពេលប្រភព្វាយ នេះ ពេលប្រភព្វាយ នេះ នោះ ពេលបាន ពេលបាន ពេលបាន ពេលបាន ពេលបាន ពេលបាន ពេលបាន ពេលបាន ពេលបា</u>យ ពេលបាន ពេលបាន

the North Atlantic States, 40 percent of the 1942 crop remains on farms, 36 percent in the East North Central, 41 percent in the West North Central, 15 in the South Atlantic, 18 in the South Central and 37 in the Western States. The United States as a whole has 37.4 percent of the oat crop remaining on the farms. Total disappearance from farms since January 1 was 379,367,000 bushels, or more than in this same period in any other year of record.

RYE: Condition of the 1943 rye crop was 82 percent of normal, about 5 percentage: points lower than a year ago, but 7 points above the 1932-41 average for April 1. A very good start was made by the crop last fall under widespread favorable conditions which resulted in a condition of 86 percent on December 1, 1942. The slight decline in prospects since that date has been chiefly in areas where snow cover was not continuous, so that severe cold spells alternating with warmer periods resulted in damage by "heaving."

In a triangular area of 13 States, from Michigan to Montana on the north down to Oklahoma, in which approximately two-thirds of all United States rye is grown, the reported condition exceeds the average. This is also true of California, New York, and the 4 Southeastern States which produce rye. In a group of 5 States touching the Ohio River the reported condition was well below average.

The only important rye-producing States in which April condition is as high as in December 1942 are Michigan, Wisconsin and Minnesota.

Farm Stocks of soybeans on April 1, 1943 were estimated at AN STOCKS: 57,610,000 bushels -- 27.5 percent of the 1942 production of 209,559,000 bushels. Although comparable estimates for the U.S. are not available for previous years, April 1, 1942 farm stocks for the two States (Illinois and Iowa) where surveys were made in past years, amounted to 20,953,000 bushels or 32 percent of their 1941 crop. On April 1, 1943, farm stocks of soybeans for these States amounted to 31,077,000 bushels -- about 27 percent of their combined 1942 production. More than half of the U.S. total farm stocks on April 1 were in these two States. Since production in 1942 was the largest on record, there is little doubt that farm stocks exceed any previous stocks on this date.

Of the 57,610,000 bushels remaining on farms April 1, somewhat over 12 million bushels will be needed for seed on farms where grown and possibly 2 million bushels are still to be fed. Thus, between 43 and 44 million bushels that could be expected to move into marketing channels or to be used as seed and feed on other farms, remained on farms April 1, 1943. To plant the prospective acreage for 1943 about 11 million bushels will be needed in addition to the 12 million bushels to be used on farms where grown.

Harvesting of soybeans from acreage seeded in 1942 continued intermittently during the first three months of the year as weather permitted. Prospects are that most of the 1942 acreage intended for harvest for beans will be finally harvested except in Ohio, Michigan, Missouri, Arkansas, and a few States of minor importance Yields of late harvested beans, however, were running lower than the favorable yields obtained prior to the adverse harvesting weather which began in November. Late harvested beans have been poor in quality and running high in moisture content - factors which have encouraged immediate marketing.

CROP REPORT as of April 1, 1943

BUREAU OF AGRICULTURAL ECONOMICS CROP REPORTING BOARD

Washington, D. C., April 9, 1943 3:00 P.M. (E.W.T.) annocumonomiconomico contractione contraction contract

CITRUS FRUITS: Total U. S. orange production for the 1942-43 season, exclusive of Florida tangerines, is now estimated at 81,626,000 boxes -- an increase of $3\frac{1}{2}$ million boxes from the Murch 1 estimate. Production totalled 82,434,000 boxes last season and 82,726,000 boxes in the 1940-41 season.

California production of navel and miscellaneous oranges is estimated at 14,880,000 boxes, compared with 22,027,000 boxes last season. Harvest of these varieties in central California is complete and in Southern California is well advanced. There was an appreciable loss of California navel and miscellaneous oranges this season from "water rot" caused by excessive moisture in February and March. Production of California valencias this season is indicated to be 27,306,000 boxes compared with 29,505,000 boxes produced in 1941-42. Excessive rainfall caused some "brown rot" damage, especially in Orange County.

Florida oranges are turning out much better than indicated earlier in the season and record crops of all varieties are now expected. Harvest of Florida early and miseason varieties is nearly completed and production (excluding tangerines) is now estimated at 19,500,000 baxes -- 2 million boxes more than the March 1 estimate. Production in 1941-42 was 15,200,000 boxes. Harvest of Florida tangerines is nearly completed and the crop is estimated at 4,500,000 boxes, compared with 2,100,000 boxes produced in 1941-42. Production of Florida valencia oranges is now indicated to be 16,000,000 boxes -- $1\frac{1}{2}$ million boxes more than indicated on March 1, and 4 million boxes more than the 1941-42 crop.

The orange crops in Texas, Arizona, and Louisiana this season are estimated at 2,900,000 boxes, 700,000 boxes, and 340,000 boxes respectively. For the 1940-41 season production in Texas totalled 2,850,000 boxes, in Arizona 660,000 boxes, and in Louisiana 192,000 boxes.

Total U. S. grapefruit production is indicated to be 46,659,000 boxes, a record crop, compared with 40,294,000 boxes produced in 1941-42, and 42,883,000 boxes in 1940-41. The Florida grapefruit crop of 25,000,000 boxes is the largest of record and 30 percent more than 1941-42 production. In Texas also a record crop of 16,600,000 boxes was produced this season, compared with 14,500,000 boxes in 1941-42. Plant quarantine regulations in that State have been modified to extend the citrus marketing season to May 31. In most seasons April 30 is set as the closing date. Arizona grapefruit production is placed at 2,415,000 boxes -- 30 percent less than produced last season. Temperatures at Phoenix during March were considerably above normal, which probably will increase grapefruit sizes but will cause some deterioration in quality. The California grapefruit crop is indicated to be 2,644,000 boxes, compared with 3,144,000 boxes in 1941-42. In the Desert Valleys (Imperial and Coachella), where harvest is underway, production for this season is estimated at 1,304,000 boxes. In other (summer harvest) areas production is expected to total 1,340,000 boxes. During the 1941-42 season, the Desert Valleys produced 1,343,000 boxes and other areas produced 1,801,000 boxes.

California lemon production is indicated to be 13,650,000 boxes compared with 11,753,000 boxes produced last season.

PEACHES - 10 Southern

States and California: On the basis of the April 1 condition, a relatively light peach crop appears in prospect for 1943 throughout the most important sections of the 10 early Southern States, with Arkansas and Oklahoma showing especially light prospects. Condition of the crop on April 1 in these 10 States was only 48 percent, compared with 77 percent on April 1 last season, and the 1932-41 April average of 65 percent.

hsj

CROP REPORT

BUREAU OF AGRICULTURAL ECONOMICS as of CROPREPORTING BOARD APRIL 9, 1943 April 1, 1943 3:00 P.M. (E.W.Z.)

Washington, D. April 9, 1943

In the important South Atlantic States of this group -- the Carolinas and Georgia --February and March freezes damaged peach buls rather generally with injury appearing to be considerably more severe in South Carolina and Georgia than in North Carolina. In general, the early-ripening varieties such as Mayflower, Uneeda, Red Bird and Early Rose escaped serious injury; but Hiley and Elberta production was reduced materially. In Georgia areas south of Macon, present prospects are somewhat more favorable than north of that point.

Prospective production in Arkansas was reduced sharply by a severe cold wave on March 2 and 3, when temperatures ranging from 4 to 12 degress above zero killed most peach buds in all areas. Elbertas, usually comprising about 80 percent of the Arkansas crop, show the heaviest damage. Orchards of early peaches escaped with considerably less injury. In the Gulf States -- Alabama, Mississippi, and Louisiana -- spring freezes also reduced peach prospects, though to a lesser degree than in Arkansas, with orchards in the northern areas of these States excaping with only minor losses.

In Texas, extremely cold weather in January, together with March freezes which followed unseasonably warm periods, caused extensive damage to peach buds. In the more important north central and eastern districts, the outlook is somewhat variable Oklahoma peach production will be extremely short due to March freezes. Near failures are expected in many orchards. Prospective production of California peaches is still indefinite. Clingstone varieties bloomed satisfactorily in nearly all areas, although moist weather, which prevailed immediately following the blooming period, was favorable for brown rot infections. The brown rot damage, however, may result only in adequate thinning. Prospects are fairly favorable for California freestone types, though the effectiveness of spraying programs for control of "curl leaf" appears to have been reduced by untimely rains.

EARLY IRISH In 10 southern States and California the April 1 condition of early POTATOES: . potatoes was 78 percent. This is somewhat above the condition on April 1,1942 and the 10-year (1932-41) average April 1 condition both of which were 76 percent.

Growing conditions in late March generally were quite favorable in these States. Early plantings which had been damaged to some extent by freezes and excessive rains have shown improvement and later plantings are getting off to a good start. In North Carolina present prospects point to the best crop in several years. From Georgia to Louisiana heavy rains and flooded fields delayed plantings and caused some rotting of seed and "skippy" stands but recent weather has been more favorable and the crop is now making good progress. In Oklahoma both surface and subsoil moisture are adequate.

Harvest of the Dade county, Florida, potato crop is about over and shipments from that State will be light for the next three weeks. The very low condition of Florida potatoes is a result of heavy damage from the mid-February and early March freezes.

The Texas Lower Valley crop, which is now being harvested, has been damaged and delayed by dry weather and freezes. Progress in other Texas areas has been good following splendid rains in late March.

In California, prospects for early potatoes were very favorable on April 1.

CROP REPORT as of

BUREAU OF AGRIQULTURAL ECONOMICS CROP REPORTING BOARD

Washington, D. C., April 9, 1943 3:00 P.M.(E.W.T.)

Wes

Na.

April 1, 1943 Pastures throughout the country as a whole appear to have come through the winter in much better condition than average, but do not look quite as good as on April I, 1942. Pastures went into the winter in generally good condition but the development of vegetation so far this spring has been held back in many areas by cool weather. Except in Arizona. New Mexico, extreme western Texas. and the western portions of Oklahoma and Kansas, moisture conditions are rather satisfactory and, with the coming of adequate warmth, spring pasture prospects are good in most sections of the country. The general pasture condition figure representing grazing conditions for all types of livestock averaged 80 percent of normal on April 1 compared with 82 percent a year earlier and a 10-year (1932-41) average of 73 percent for that date. The condition of dairy pastures - combining condition figures in only those States where milk cows are normally grazing by April 1 - averaged 73 percent of normal compared with 75 percent on April 1, 1942, and 72 percent for the April 1 average for the 10-year period 1932-41.

The South was overspread with freezes in mid-February and early March and many sections of the area were also visited by quite cold weather the latter part of March. Pastures were particularly retarded by the cold weather in the South Central States where the condition averaged 68 percent of normal on April 1 compared with 72 percent a year ago and a 10-year average (1932-41) of 69 percent. Pastures and ranges in the Western States as a whole appeared to be in about as good condition as a year earlier but cold March weather in Washington and Oregon greatly retarded vegetation in those States. March weather has been very favorable in California and pastures are in much better condition than on April 1 last year and are far better than average. In most of the Northern States, where grazing still is restricted to old feed, new growth will develop somewhat later than usual but the prospects for considerable feed from pastures this spring are reported as good to very good.

MILK PRODUCTION: During March, milk production made about the usual seasonal advance. United States production during the month, estimated at 9-3/4 billion pounds, exceeded that of March 1942 by about 1 percent. herds contained enough more milk cows this year to somewhat more than offset the slightly smaller milk production per cow. On a per capita basis (total population). the March production of milk equalled the previous high record for the month set last year and was almost up to the usual per capita figure for April.

On April 1, milk production per cow averaged the second highest for the date in 19 years of record, being exceeded only by production on the same date last year. Continued heavy supplementary feeding of milk cows helped maintain production during the intervals of cold, stormy weather in the first three weeks of March and encouraged rapid increases with the coming warmer weather toward the end of the month.

In the group of important northern milk producing States from Wisconsin eastward, April 1 milk production per cow was slightly below that on April 1, 1942, but was higher than on the same date in any other year of record, In the West North Central States, which supply a large part of the Nation's butter; production per cow was above a year ago but below that on April 1, 1941. In the South production per cow was rather generally below a year earlier, and in Texas, Oklahoma and Arkansas was considerably below the 10-year average for April 1. The seasonal increase of production in these areas has been retarded by cool weather and late development of pastures, and the level of production per cow has been held down by the small percentage of milk cows being milked. A late spring in the Western States held back the seasonal rise in milk flow this year, and April 1 production per cow, though slightly above that on April 1, 1942, was materially lower than on the same date in 1940 or 1941. For the country as a whole, daily milk production per cow in herds kept by crop correspondents averaged 14.85 pounds on April 1. compared with 14.96 pounds on that date last year and a 1932-41 average of 13.60 for April 1. In these herds, the percentage of the milk cows reported in production - 69.2 percent - was less than on the same date of any of the past 5 years, but showed somewhat more than the usual increase from March 1.

CROP REPORT as of

BUREAU OF AGRICULTURAL ECONOMICS CROP REPORTING BOARD

Washington, D. C., April 9, 1943 April 1, 1943 3:00 P.M. (E.W.T.)

POULTRY AND EGG Hens and pullsts on farms laid 6,462,000,000 eggs in March, a record for the month -- 17 percent above the production in March last year and 46 percent above the 10-year (1932-41) average. March egg production was at top levels in all parts of the country, except in the West where it was the largest since 1931. The aggregate production in the first 3 months of this year was the largest record for the period -- 16 percent above the first quarter in 1942.

The rate of egg production per layer during March tops all previous rates for the month -- 15.74 eggs per layer compared with 15.51 last year and 14.18, the 10-year average. The number of eggs per layer during the first quarter of this year was 35.48 eggs, compared with 35.15 during the same period in 1942.

There were 410,532,000 layers on farms during March, an increase of 16 percent from March last year and 31 percent above the 10-year average. Because of the high prices for chickens and eggs as well as favorable feed-price relationships, numbers of layers on farms reached a record high March level. Culling has been lighter than usual this year and early hatchings indicate another increase in layers.

There were 227,401,000 chicks and young chickens of this year's hatching on farms April 1. This is the largest number on this date in the last 13 years of record --23 percent above a year ago and 71 percent above the 10-year average. The largest increases were in the more commercialized areas in the North Atlantic and Western States -- 31 percent and 29 percent respectively -- and the smallest increase was 10 percent in the South Atlantic States.

CHICKS AND YOUNG CHICKENS ON FARMS APRIL 1

Numbers of eggs set and chicks hatched by hatcheries during March were at record levels, with the demand for chicks unsatisfied. Chicks booked on April 1 for later delivery far exceeded any previous number booked on that date.

Prices received by farmers for eggs in mid-March were the highest for the date since 1920 -- 32 percent above a year earlier and 119 percent above the 10-year average. The March 15 price was 34.0 cents per dozen compared with 25.8 cents a year earlier and 15.5 cents, the 10-year average for the date.

The mid-March price of chickens -- 23.5 cents per pound live weight -- was also the highest since 1920 and the second highest in 34 years. It was 31 percent above a year ago and 74 percent above the 10-year average.

Turkey prices on March 15 averaged 28.7 cents per pound live weight compared with 19.9 cents a year earlier and 15.6 cents, the 5-year (1937-41) March 15 average.

The average cost of feed in a farm poultry ration on March 15 was \$1.92 per 100 pounds, which is 16 percent above a year earlier and 69 percent above the 10-year average.

Annual estimates, "Farm Production and Income, Chickens and Eggs, 1941-42, By States" and "Farm Production and Income of Turkeys, 1941-42, By States" are now available upon request to Crop Reporting Board, Bureau of Agricultural Economics, Washington, D. C.

1/ Relates to crop from bloom of year shown. In California the picking season usually extends from about October 1 to December 31 of the following year. In other States the season begins about October 1, except for Florida limes, harvest of which usually starts about April 1. For some States in certain years, production includes some quantities donated to charity, unharvested, and/or eliminated on account of market conditions. Alabama and Mississippi production negligible since 1938. 2/ Includes small quantities of tangerines. 3/ Short-time average. 4/ December 1 indicated production.

indicated production.

^{1/} Averages represent the reported daily milk production of herds kept by reporters divided by the total number of milk cows (in milk or dry) in these herds. Figures for New England States and New Jersey are based on combined returns from crop and special dairy reporters. Figures for other States, regions, and U.S. are based on returns from crop reporters only. The regional averages are based in part on records of less important dairy States not shown separately, as follows: North Atlantic, Rhode Island; South Atlantic, Delaware and Florida; South Central, Louisiana; Western, New Mexico, Arizona, Utah and Nevada.
